ARTIFICIAL INTELLIGENCE

TrueSight™

AI-powered credit and financial risk assessment for conventional lending and Shariah financing.

Supporting exhibit for Section B of the Malaysia Digital Status application. This document describes the proprietary software, its operating architecture, data-protection controls, model strategy and five-year planning projections. It does not constitute legal, Shariah or financial advice.

PREPARED BY

Truestack Technologies Sdn. Bhd.

DOCUMENT CONTROL

Section B supporting exhibit

September 2026
Solution name: TrueSight™
First commercial use (planned): Q1 2027

CONTENTS

1. Problem and proposed solution
2. Modules and system architecture
3. Data privacy and data sources
4. Artificial intelligence and AWS Bedrock
5. Interface, technology and distribution
6. Intellectual property, projections and example

Qualifying activity. TrueSight is proprietary software for scoring, monitoring and explainability, delivered as a hosted service and API. It is not money lending, a credit bureau, Shariah advisory, training, hardware, marketing, or a social-media service. The Company does not originate or collect financing on its own book. Conventional and Shariah customer data are not held on a shared tenancy.

1 — PROBLEM

Credit decisions still rely on delayed and incomplete information.

Malaysian lenders and financing operators typically assess a borrower from a bureau extract, supporting documents and records in the loan or pembiayaan system. That view is often days or weeks old by the time a credit committee sits. It also rarely shows whether the same person or company is already stretched on another book.

The same limitation applies to Shariah financing. Affordability and cash flow remain material. What must not occur is treating deferred profit as interest, combining Ta'widh with Gharamah, or running a Shariah book through the same risk engine and infrastructure as a conventional licence. If a Shariah committee cannot see why a customer was approved, it is being asked to rely on assertion rather than evidence.

Point-in-time bureau scores

CCRIS or CTOS extracts describe a past position. Income, utilisation and other-lender activity can change between the pull and the decision.

Thin-file customers

SMEs, the self-employed and younger applicants often have limited bureau history. Officers then either decline or improvise, because the model only reads a credit file.

Inconsistent judgement

Without a documented method, the same pack produces different limits depending on the officer. Subsequent audit sees the outcome, not the reasoning.

Late identification of stress

Falling balances, rising commitments and missed instalments are often noticed in collections, not at origination or during scheduled monitoring.

ISLAMIC DIGITAL ECONOMY

Why a conventional scorecard is not sufficient for a Shariah book

A conventional engine looks for interest, late interest and a single arrears field. A Tawarruq facility has a deferred sale price, a profit margin already approved in the Aqad, and two late-charge ledgers that must remain separate: Ta'widh (compensation, capped) and Gharamah (penalty, payable to charity). If the model cannot distinguish those fields, the operator cannot demonstrate that risk assessment remained within the approved contract. TrueSight is designed so that it can.

1 — PROPOSED SOLUTION

TrueSight is the decision layer. The officer remains accountable.

TrueSight is Truystack's proprietary AI service for borrower and customer creditworthiness. It consumes data the institution is entitled to use, applies rules and calibrated models, and returns a score, a probability of default, the principal reasons, and a recommended next step. After a facility is booked, the same engine re-scores the account on a schedule.

The licensed lender or Shariah financing operator remains the decision-maker. TrueSight does not originate, disburse or collect. It does not issue a fatwa, approve an Aqad, or execute a commodity trade. Those functions remain with the operator, the committee, and TrueSyariah / TrueCommodity where they apply. Adjacent Truystack products (TrueIdentity, document extraction, AML screening) are treated here as data sources, not as separate Malaysia Digital activities.

SCOPE OF THE ACTIVITY

DIGITAL FINANCE

Conventional credit

KPKT-licensed money lenders, fintech credit companies and digital lenders on TrueKredit or a third-party loan system. Interest-bearing products, debt-service ratios, utilisation, bureau and bank data.

ISLAMIC DIGITAL ECONOMY

Shariah pembiayaan

Operators on TrueSyariah. Tawarruq and deferred-profit facilities; affordability against the sale price; Ta'widh and Gharamah as separate features; explanations suitable for committee review. No interest field, and no invented profit rate.

OPERATING STAGES (SAME INTELLECTUAL PROPERTY; ISOLATED DEPLOYMENTS)

1. Data

Permitted sources only, with consent and purpose recorded.

2. Financials

Income, cash flow and debt service — profit, not interest, on a Shariah book.

3. Risk engine

Score, PD and expected-loss inputs. Features are book-specific.

4. Decision aid

Approve, conditions, review or decline. Amount and tenure.

5. Monitor

Re-score booked accounts. Early warning. Portfolio view.

Excluded from this activity. Money lending; operating a credit bureau; hardware; marketing, advertising or social-media services; training or certification; standalone consultancy or Shariah advisory. TrueSight does not replace the Shariah committee. It is not deployed on infrastructure shared with a conventional book.

2 — MODULES

Nine software functions in one service.

Each item below is a software module. Officers use it in the console; other systems call it through an API. None of these items is a workshop, campaign or advisory engagement.

1. Data intelligence

Normalise bureau extracts, bank and transaction files, LMS or TrueSyariah records, and statements into a feature table. Network matching uses consented hashed identifiers (NRIC or SSM). Raw loan files are not pooled.

2. Financial health

Income stability, expense pattern, cash-flow volatility, debt service, utilisation and recent deterioration. On a Shariah book the engine uses deferred profit and instalments on the sale price.

3. Credit risk engine

Supervised models (gradient-boosted trees) produce a TrueSight score, probability of default over defined horizons, and inputs to expected loss. Example output: score 78/100, PD 4.2%, suggested facility RM50,000.

4. Explainable AI

Ranked factors that moved the score, written so a credit officer, internal auditor or Shariah committee member can follow the result without a data-science background.

5. Decision support

Maps the score to approve, conditions, manual review or decline, plus amount and tenure. Conventional mode may suggest risk-based pricing. Shariah mode does not invent a profit rate; that remains inside the approved Aqad.

6. Early-warning monitor

Re-scores booked accounts when new permitted data arrives. On Shariah books, Ta'widh and Gharamah are separate signals, not a single late-interest flag.

7. Portfolio intelligence

Book-level PD and expected loss, grade mix, concentration, vintage and watchlist — produced from that book's own tenancy.

8. Consented network signals

Optional. A hashed identity may be matched only against participating books of the same type. Cross-type matching between conventional and Shariah is not performed.

9. Shariah financing mode

The same engine, deployed only on the operator's dedicated TrueSyariah AWS Malaysia tenancy. Feature dictionary includes deferred sale price, profit margin, Ta'widh outstanding, Gharamah outstanding (charity, not income) and commodity-trade completion flags from TrueCommodity where present. TrueSight scores the customer and the facility; it does not execute Tawarruq or rule on contracts.

2 — SYSTEM ARCHITECTURE

The assessment runs in the existing loan file. Results are written back with a model version.

PRESENTATION LAYER

Credit users work in a web console (React, Next.js, TypeScript): borrower 360°, score and PD, explainability panel, recommendation, early-warning queue and portfolio boards. On TrueKredit the panel is embedded on the borrower and application screens. On TrueSyariah it sits on the facility file, with pembiayaan labels. A third-party loan system may call the API and never open the Truystack console.

APPLICATION AND DATA

Node.js services receive HTTPS requests. Data is validated and stored in that client's isolated PostgreSQL database on AWS Malaysia; Redis holds short-lived feature lookups. A feature pipeline builds the model table. Inference returns score, PD, explanations and a recommendation. Every call is audit-logged: requester, time, model identifier and book type.

REQUEST SEQUENCE

1. The loan or pembiayaan system (TrueKredit, TrueSyariah, or another LMS) submits identifiers and permitted fields, or the officer works in the console.
2. Ingestion verifies consent flags and book type. A Shariah request directed at a conventional tenancy is refused, and the reverse.
3. Features are built for that book type. Hashed network lookup, if enabled, runs only against participating books of the same type.
4. Rules and classical models produce the score. An LLM, where used, writes the narrative from a bounded case context — it does not set the PD.
5. The payload is stored against the file and returned. Scheduled jobs re-score booked accounts using only data still covered by a valid purpose.

CLOUD HOSTING

Amazon Web Services, Malaysia region. Truystack hosts the TrueSight inference service, including the AWS Bedrock model gateway, in Malaysia. Each client's borrower and facility data remains on that client's dedicated AWS Malaysia account — the same pattern used for TrueKredit and TrueSyariah. A Shariah operator is never placed on a tenancy that also holds conventional loans. Hashed network features, where used, are derived signals, not a copy of another lender's file.

Data residency

Personal data is stored in Malaysia.
Encryption in transit and at rest.
Backups remain on the client tenancy.

Isolation

One AWS account, database and secrets vault per operator. The Shariah ring-fence is architectural, not a query filter.

Audit

Model version, feature snapshot and explanation are stored with the decision and can be reconstructed for committee or regulatory review.

2 — DECISION FLOW

Capture, normalise, evaluate, decide, monitor. Each stage has its own controls.

Separating these stages allows the operator to control cost, explainability and the information an LLM is permitted to see. Identity, documents, AML and external signals feed TrueSight; they are not presented as separate qualifying activities in this application.

CONTROL PLANE (APPLIES TO EVERY STAGE)

Consent and PDPA purpose limitation · data classification · model routing (which Bedrock model, which region) · human-review thresholds · prompt and inference logs · retention and deletion. Ambiguous or high-risk external signals are routed to an officer. They are not silently absorbed into the grade.

What is permitted to predict risk

Probability of default, affordability and fraud flags are produced by rules, scorecards and gradient-boosted trees (XGBoost / LightGBM). Those models are measurable, calibrated and versioned. A generative model does not own the credit score.

Role of the language model

Normalising extracted fields, drafting the reasons an officer will record, flagging inconsistencies, and assembling the evidence pack. If the language model is unavailable, scoring still runs. A narrative without a score is not a decision.

On a Shariah tenancy the same five stages apply. The feature dictionary and the decision outputs change; the control plane does not. Book type is checked before any Bedrock call. A conventional prompt template cannot receive a Shariah case, and the reverse.

3 — DATA PRIVACY

Personal data is processed only for a stated credit or financing purpose.

TrueSight is designed around the Personal Data Protection Act 2010 (as amended), purpose limitation, and Malaysian data residency. Additional data — including any future telco, e-commerce or BNPL feed — is not connected until a lawful basis, a processing agreement and a data-protection impact assessment are in place. Truestack does not sell personal data and does not train foundation models on borrower files.

Lawful basis and consent

Each source is tagged with origin, timestamp, confidence, collection basis and retention rule. Sensitive or third-party data is collected only after a clear purpose statement. The applicant may access, correct or request deletion where the PDPA so requires.

Data minimisation

The platform stores features required for the decision, not a copy of a partner's entire customer database. Call content, precise location trails, private messages and browsing histories are not in scope. Preference is given to derived indicators (for example payment regularity) over raw event logs.

Residency and isolation

Production personal data, extracted documents, logs and backups are held in the AWS Malaysia region on the operator's dedicated tenancy. Conventional and Shariah books do not share a database. Cross-border model calls, if ever required, use redacted payloads and customer approval, or wait for an in-region model.

Explainability and fairness

Every field used in a score or a decline must have a plain-language explanation path. Web, social or alternative-data signals are not used as hidden proxies for protected characteristics. Ambiguous signals default to human review.

Processors and models

AWS is the cloud and Bedrock processor. Borrower PII is not used to fine-tune Bedrock models. Prompt and output logs are retained or deleted under the client's retention schedule. Open-weight or private endpoints may be used for higher-sensitivity workloads.

Regulated customers

For Bank Negara-regulated institutions, the design supports outsourcing and RMIT expectations: data-location records, access control, incident notification, audit logs and the ability to reconstruct a decision. Operational assurance (encryption, key management, vulnerability management) is part of the control plane, not an afterthought.

Hierarchy of sources. Official records and customer-provided evidence take precedence over partner or web content. A telco, marketplace or BNPL signal cannot override a court or SSM record, and cannot enter the score unless the operator can explain it to the applicant and to an auditor.

3 — DATA SOURCES

Current sources, and sources that may be connected later.

TrueSight does not assemble a borrower by scraping the public internet. It consumes sources the operator is entitled to use. Potential partner feeds (telecommunications, e-commerce, buy-now-pay-later) are listed as a roadmap, not as data already in production.

IN PRODUCTION OR IN THE PRODUCT DESIGN (SUBJECT TO THE OPERATOR'S LICENCES AND CONSENT)

SOURCE	CONTENT	USE IN TRUESIGHT
Operator's book	Application, repayment history, fraud labels, servicing and collections events from TrueKredit or TrueSyariah.	Primary feature set. Outcomes later retrain scorecards. Does not leave that tenancy.
Trueidentity	MyKad OCR, liveness, face match, KYC result, consent record.	Verified identity; fraud indicators; blocks a synthetic file before scoring.
Document extraction	Bank statements, payslips, contracts and forms, with tamper checks.	Income, expenses and cash-flow behaviour. LLM used only as a second pass.
AML screening	Sanctions, PEP, adverse-media hits, watchlist refresh, reviewer disposition.	Policy gates and monitoring. A hit is evidence, not an automatic decline without review.
Official and bureau	SSM, insolvency and court notices; CTOS / CCRIS-equivalent files the client is licensed to pull.	Preferred over any non-official source.
Network (optional)	Hashed NRIC or SSM match against participating books of the same type.	Aggregated performance bands only. Conventional never matches Shariah.
Public diligence	Company websites, public adverse media, public business or marketplace profiles — where consented and relevant.	Corroboration. Not social-media marketing. Default route is human review, not a silent score input.

TrueSight does not provide social-media, advertising or campaign services. Public web and social records, if used at all, are optional diligence signals with source tags, timestamps and reviewer disposition.

3 — POTENTIAL PARTNER DATA

Telco, e-commerce and BNPL data may be added only under contract and consent.

These sources can improve assessment of thin-file SMEs and individuals. They also raise privacy risk. They will not be switched on for an operator until a data-processing agreement, a documented purpose, applicant-facing notice and a technical minimisation design are complete. Raw partner dumps are not stored in TrueSight.

POTENTIAL SOURCE	FEATURES THAT MAY BE USED	EXPLICITLY OUT OF SCOPE
Telecommunications	Account tenure, prepaid or postpaid status, bill-payment regularity, SIM-swap or device-change alerts supplied by the telco under contract.	Call content, SMS content, cell-tower or GPS trails, contact lists, browsing on the mobile network.
E-commerce / marketplace	Seller or buyer tenure, fulfilled-order volume, late-delivery or return rates, account standing — as aggregated features from the platform.	Item-level browsing, wish-lists, private messages, recommendation graphs, unrelated household purchases.
Buy-now-pay-later	BNPL repayment performance, outstanding BNPL exposure, recency of missed instalments, where the customer has authorised the share.	Full shopping baskets, marketing segments, or any BNPL book mixed across conventional and Shariah tenancies.

Conditions before go-live of a partner feed

Written lawful basis · purpose limited to credit or pembiayaan risk · DPA with the source institution · encryption in transit · features not raw event stores · retention schedule · explainability path · opt-out or challenge process where applicable · DPIA recorded · conventional/Shariah isolation preserved.

What will not happen

No purchase of unlawfully compiled lists. No silent scoring from social graphs. No use of telco or marketplace data as a proxy for ethnicity, religion or similar attributes. No training of Bedrock models on partner PII. No transfer of a Shariah customer's alternative data onto a conventional tenancy.

Status. Telco, e-commerce and BNPL connectors are a planned capability of the risk data layer, not a claim that such feeds are live. Until connected, TrueSight operates on operator-owned, official, bureau and consented module data described on the previous page.

4 — ARTIFICIAL INTELLIGENCE

Classical models produce the score. AWS Bedrock is used for language, with cost-aware routing.

AWS Bedrock is the managed model layer. Business logic is not hard-wired to a single provider or model. A Model Gateway selects the route, logs the call and can fail over. The cheapest model that meets the quality threshold for that task is preferred.

Model Gateway

Single interface for routing, cost controls, evaluation and audit. Malaysia-region models are preferred. If a required model is unavailable in-region, only redacted or customer-approved payloads may leave, or the job waits for an in-region alternative.

Prohibited uses

No fine-tuning of Bedrock models on borrower PII. No generative model setting the probability of default. No Shariah case sent to a conventional prompt template, or the reverse.

TASK	TYPICAL ROUTE	RATIONALE
Document extraction	Specialist OCR / document AI first; LLM second pass (GLM Flash or Amazon Nova Lite class on Bedrock).	High volume. Deterministic extraction is cheaper; the LLM only normalises fields and flags contradictions.
Transaction classification	Nova Lite / GLM Flash class, tested on labelled Malaysian statements.	Repetitive work where cost and Bahasa Malaysia / English coverage matter.
Risk narrative and exceptions	Claude, GLM or Nova Pro class via Bedrock.	Requires structured output and a paragraph an officer can defend. Receives a bounded case context, not a raw document dump.
Public diligence (optional)	Search tools plus a research-class model only where contracted.	Adverse-media discovery is separated from the score. A reviewer must dispose the hit.
PD, affordability, fraud probability	Scorecards and XGBoost / LightGBM on the feature store. Not Bedrock.	Must be calibrated, monitored for drift, and replayable from a model version identifier.

Training

Scorecards and tree models are trained, and periodically retrained, on labelled Malaysian outcomes: defaults, arrears, fraud flags and officer overrides. Labels remain on the operator's tenancy unless a separate, de-identified pooling agreement exists. The long-term advantage is a Malaysia-specific corpus (local forms, naming, SMEs, informal income), not a particular large language model.

Memory

There is no conversational memory that carries one borrower into another tenant. Working memory is the risk data layer: the case file, the feature store, consent evidence, and the outcome written back after the facility performs. The LLM sees only the facts assembled for that request. Prompts, model identifiers, token counts and outputs are logged, then retained or deleted under the client's PDPA schedule.

5 — INTERFACE

Working mock-up: TrueSight on the New Borrower screen.

The panel on the right is the engine output at the point the officer is still creating the record. It is not a report produced the following day.

Cross-tenant insights while creating a borrower

Borrowed from 1 other lender

Lenders: Demo Company Sdn Bhd

DATA CONSISTENCY WITH OTHER LENDERS

Name: Matches

Phone: Different

TOTAL BORROWED RANGE

RM 500,000 - RM 1,000,000

High risk · On-time 0-10%

102 Active · 2 Completed · 0 Defaulted · 0 Late

Last borrowed 21 days ago (agreement date)

Last platform payment activity 14 days ago

Tips

SSM Number: Enter the company registration number exactly as shown on the SSM certificate.

Network history

Hashed match against participating books of the same type. In this example, borrowing from one other lender; last facility 21 days ago.

Consistency

Name matches the other file; telephone number does not. That is a data-quality flag, not an automatic decline.

Risk band

Exposure shown as a range, with an on-time band and activity counts — sufficient to pause a file that would otherwise look clean on SSM alone.

Illustrative user interface. The product is not generally released. A TrueSyariah embedding uses the same panel on the facility file, with pembiayaan labels and no interest fields.

Truestack Technologies Sdn. Bhd. · 202501058714

TrueSight™ Technical Overview · 11 / 16

5 — TECHNOLOGY

Stack, advanced methods, and how TrueSight differs.

LAYER	TOOLS	PURPOSE
Frontend	Next.js, React, TypeScript	Console and in-file panel on TrueKredit and TrueSyariah.
Application	Node.js, HTTPS APIs	Ingestion, consent and book-type checks, write-back, audit log.
Data	PostgreSQL, Redis, Docker, feature store	Client-isolated stores on the operator's AWS Malaysia account.
Cloud	AWS Malaysia; AWS Bedrock (Model Gateway)	Inference and language models in-region where available; dedicated client tenancy.
Predictive AI	XGBoost / LightGBM, scorecards, feature attribution	Score, PD, ranked reasons. Separate dictionaries per book type.
Language AI	Bedrock: Nova Lite / GLM Flash; Claude / Nova Pro / GLM for narratives	Extraction second pass, classification, evidence packs. Cost-routed.

Explainable, not opaque

International tools often stop at a grade. TrueSight lists the factors that moved the file, in language suitable for a credit memo or a Shariah committee pack.

Continues after origination

The same models re-score after booking. Early warning is a scheduled run of the engine, not a separate product attached later.

Network signal without pooling files

Where customers consent, hashed matches can show activity on another participating book of the same type. Each operator retains a dedicated AWS tenancy. Truestack does not operate a shared bureau.

Fits the system already in use

Embedded in TrueKredit and TrueSyariah, or called by API from another LMS. The operator is not required to replace origination in order to obtain a documented risk view.

ISLAMIC DIGITAL ECONOMY**A Shariah book requires a Shariah feature dictionary, not a relabelled interest model**

Imported scorecards are typically trained on interest-bearing products. TrueSight's Shariah mode scores deferred profit, keeps Ta'widh and Gharamah apart, and will not recommend an interest rate. Deployment is only on the TrueSyariah tenancy. TrueSight does not replace the advisor or the committee.

5 — HOW TRUESIGHT REACHES THE MARKET

It ships inside TrueKredit, and it is also opened as an API.

A standalone scoring tool has to win a new workflow. TrueSight does not. Licensed lenders already run their books on TrueKredit — origination, schedules, collections and KPKT paperwork, on their own AWS Malaysia tenancy. TrueSight is built to sit in that file. Operators who do not use TrueKredit can call the same engine through an API and keep the system they already have.

CHANNEL 1

Native in TrueKredit

TrueSight is embedded on the borrower and application screens of TrueKredit, which is already in production with licensed Malaysian money lenders. The officer does not open a second system. The score, PD, reasons and recommendation are written onto the same record as the loan, the repayment schedule and the Lampiran. Isolation, audit logs and Malaysia residency are the ones that tenancy already uses.

Because the LMS already holds applications, commitments, disbursements and arrears, TrueSight is not scoring from an empty payload. That is the practical advantage over a vendor who only receives a bureau extract through a new integration.

CHANNEL 2

Open API

The same TrueSight engine is exposed as an HTTPS API for banks, fintechs, credit companies and operators whose loan or pembiayaan system is not TrueKredit. They submit permitted fields, receive score, PD, explanations and a recommended next step, and write the result into their own file. They do not have to move the loan book.

The control plane does not change: consent and purpose, book-type lock, dedicated AWS Malaysia tenancy, model-version logging, and the same prohibition on mixing conventional and Shariah data. The API is a delivery method, not a second product with weaker controls.

ISLAMIC DIGITAL ECONOMY

TrueSyariah operators use the same two channels

On TrueSyariah, TrueSight is embedded on the facility file, with pembiayaan labels and no interest field. A Shariah operator on another platform may call the API in Shariah mode. In both cases the request is served only from that operator's dedicated TrueSyariah tenancy. The API will refuse a Shariah payload pointed at a conventional endpoint.

What this means for the activity. Distribution through an LMS that is already live shortens time-to-use for existing clients. The API extends the same proprietary engine to institutions that will never replace their core system. Both paths are software licensing and usage of TrueSight — not consulting, not a bureau, and not a requirement that the customer abandon their current origination stack.

5 — INTELLECTUAL PROPERTY

The intellectual property is TrueSight. Trademark filing with MyIPO is intended.

The application's "AI-Powered Credit & Financial Risk Assessment" refers to this product. The Company intends to register TrueSight as a trademark with MyIPO. Filing has not yet been submitted. Copyright attaches to software and documentation authored in Malaysia. Model weights, feature dictionaries and hashed-matching methods will be held as trade secrets. Selected methods may later be reviewed for patentability; no granted patent is claimed here.

Trademark

TrueSight™ — name and device, to be filed at MyIPO, replacing earlier working labels such as "CrediSense AI".

Copyright

Source code, consoles, documentation, model cards and database structure, authored by Truestack's Malaysian engineering team.

Trade secrets

Scoring method, training process, conventional and Shariah feature dictionaries, hashed network matching, threshold calibration and the Model Gateway routing rules.

Not claimed

The operator's Aqad, committee rulings, and commodity-trade contracts executed through TrueCommodity remain the operator's and the committee's.

CORE PROPRIETARY PIECES

AI models and scoring method · financial-health analysis · probability-of-default models · explainable AI · early-warning monitor · data-processing and hashed matching · Shariah feature dictionary and book-isolation rules · decision-support mapping (with Aqad-safe outputs on Shariah mode) · Bedrock Model Gateway (task routing, region controls, cost caps).

All of the above is developed in-house in Malaysia. Third-party tools (AWS, Bedrock foundation models, open-source libraries, bureau files supplied by the client) are inputs. They are not the Company's intellectual property.

SHARIAH

TrueSight does not own, and does not seek to own, the operator's Aqad, the committee's rulings, or commodity-trade contracts. The intellectual property is the software that scores a customer on a book that already has those contracts in force.

Development commenced in **Q2 2026**. The product was presented on the Company website (as coming soon) in **Q3 2026**. First commercial use is planned for **Q1 2027**. No TrueSight invoice has been issued to date.

6 — FINANCIAL PROJECTIONS

Five-year planning case. Years 1–3 are canonical; Years 4–5 continue the same path.

Years 1–3 are taken from the Company's Unified Risk Intelligence platform brief (September 2026) and are the planning numbers to use in this application. Years 4–5 extend that case on the same customer-growth, volume, blended-usage and margin trajectory so the projection matches a five-year Malaysia Digital horizon. Figures are directional planning assumptions, not a forecast. Year 1 is calendar 2027.

ITEM	Y1 · 2027	Y2 · 2028	Y3 · 2029	Y4 · 2030	Y5 · 2031
Production customers (year-end)	8	24	55	90	130
Module-equivalent checks	240,000	1.2 million	4.0 million	7.5 million	12.0 million
Subscription revenue (RM million)	0.45	1.90	6.50	13.20	22.50
Usage revenue (RM million)	1.08	4.56	12.80	21.75	32.40
Platform configuration (RM million)	0.18	0.40	0.75	1.00	1.30
Total revenue (RM million)	1.71	6.86	20.05	35.95	56.20
Gross margin	62%	70%	76%	78%	80%

Years 1–3 (canonical)

Unchanged from the September 2026 brief: 8 / 24 / 55 production customers; 240 thousand / 1.2 million / 4.0 million module-equivalent checks; total revenue RM1.71 million / RM6.86 million / RM20.05 million; gross margin 62% / 70% / 76%.

Years 4–5 (extension)

Customer growth continues at a slower rate (55 → 90 → 130). Checks scale to 7.5 million then 12.0 million. Blended usage revenue per check continues to fall (about RM2.90 in Year 4, RM2.70 in Year 5). Margin steps to 78% then 80% as Bedrock routing and extraction automation compound.

Notes for the application. Platform configuration is implementation of the Company's own software (connectors, policy thresholds, API enablement), not standalone consulting. External bureau, registry and partner-data fees are pass-through and are excluded. Major custom-build costs are excluded. These totals should replace earlier Section B figures that summed to RM1.26 million in Year 1 and RM18.4 million in Year 5.

6 — EXAMPLE / CASE STUDY

Illustrative file: a clean SSM record with hidden concentration.

This walkthrough is illustrative. It is not a live customer and not a completed sale. Figures match the mock-up on page 11 so the method can be read against the interface.

CONVENTIONAL SETTING

Apex Credit Sdn. Bhd. (fictional) is a KPKT-licensed money lender with approximately 1,800 live personal loans on TrueKredit. The officer opens **Tech Solutions Sdn. Bhd.**, SSM 202201012345, manufacturing, incorporated 2017.

SHARIAH SETTING

The same engine, on a separate tenancy, would support a TrueSyariah operator assessing a Tawarruq working-capital facility. Profit terms would already sit in the approved Aqad. TrueSight would not propose an interest rate; it would address amount, tenure and whether the file should go to review.

SEQUENCE ON THE CONVENTIONAL DESK

1. SSM lookup is in order. Papers in the file show no obvious litigation. A bureau-only read would likely support approval at a mid five-figure limit.
2. TrueSight Preview runs as the officer enters the SSM number. Hashed match: already borrowing from one other participating lender. Name matches; telephone number does not.
3. Exposure band RM500,000–RM1,000,000. On-time band 0–10%. Activity counts and recency as shown on page 11. Risk band: high.
4. Recommendation: manual review; cap new exposure; request current bank statements; reconcile the telephone discrepancy before disbursement. No telco, e-commerce or BNPL feed is required for this conclusion.
5. If a smaller facility is later booked, monitoring continues on permitted features only. A further rise in utilisation raises an early-warning item rather than waiting for a missed instalment.

Without TrueSight

The officer sees a manufacturer with an SSM number and a complete form. Concentration at other lenders is not visible. Contact-data inconsistency is easy to miss. The committee pack contains a score without supporting reasons.

With TrueSight

The officer still decides. The file now carries a documented high-risk band, a network flag and a list of factors. That record is the audit trail. On a Shariah desk, it is what the committee can sample.

This example does not claim a reduction in default rates. TrueSight has been in development since Q2 2026 and is not generally released. It is included so that the method is concrete for assessment of this application.
